Problem Statement

- Technical teams consistently struggle to produce documentation
- Writing docs is seen as low-value compared to building
- When documentation does exist, it's often incomplete because the person writing it already knows the system too well to remember what a newcomer needs to know

The result is institutional knowledge that lives in people's heads, onboarding that lives in people's heads, onboarding that takes longer than it should, and processes that break down when key people aren't available.

Solution Overview

- Docu-Bot is a conversational AI agent that produces documentation through dialogue
- Rather than asking a developer or a team lead to sit down and write, it interviews them asking one focused question at a time
- When it has gathered enough context, it generates a clean, structured markdown document ready for review and publishing.

Recorded Demo

Value Proposition

- Docu-Bot lowers the cost of documentation to near zero
- A team member who would never carve out two hours to write a README can answer ten questions in a five-minute chat and walk away with a publishable document
- The conversational format also produces better output than a blank page would, the agent knows what questions to ask, so nothing obvious gets left out
- Teams get living documentation that actually exists, stays current, and doesn't require a dedicated technical writer to maintain.

CS 2027

Technical Details

Model: gpt-oss-120b

- Context Window: 128,000
- Input Modalities: Text
- Sensitivity: LMPI, CUI, ECI, Unrestricted

Challenges & Lessons Learned

- Getting the agent to follow a more natural conversation flow took multiple fallback conversation suggestions in my prompt and much testing
- Designing a conversation flow that gather information quickly in the limited context window required attention to detail
- I could do this again I would ask more people to test the agent to flush out as many issues as possible
