THE PROBLEM

Work stalls in two predictable moments

Critical context is fragmented across Teams, Outlook, calendars, and browser-based tools — employees rebuild it from scratch every morning, and again every time they return from time away.

• Based on our own survey of 140 respondents across every Business Area

01 • MORNING BRIEF

78 min average
per employee, per morning

spent checking Teams, Outlook & Calendar before real work starts

159,900 hours lost every single morning
78 min x ~123,000 employees

02 • OUT-OF-OFFICE CATCH-UP

3.5 hrs median
catch-up time on return

spent on messages, email & calendar for those out 1+ week

80%
of respondents have been out of office more than one week — this isn't rare, it's routine

Applied at scale, catch-up time compounds into weeks of lost productivity across the organization every year.

THE SOLUTION

UNIFY turns scattered signals into one prioritized brief

So employees can start with context, not manual catch-up.

WHAT UNIFY DOES

 **Morning Brief**
Summarizes what changed overnight and flags what needs your attention before the day begins.

 **Out-of-Office Catch-Up**
Compresses missed messages, meetings, and action items into one clear return brief.

 **Action Item Finder**
Surfaces tasks, asks, and follow-ups buried across Teams and Outlook messages.

 **Designed for Teams**
Built for both technical and non-technical employees across every business area.

HOW IT WORKS

Connect your key apps and sources like Outlook, Teams, Calendar, and the web.

Unify and structure signals into priorities, summaries, and actions.

Send the organized context to Navigator so it's ready for the day.

Receive a clear, prioritized brief aligned to your day and timeline.

WHY THIS IS DIFFERENT

- ✓ Uses existing work context — no extra capture
- ✓ Built around the highest-friction workflows in our survey
- ✓ Fits inside existing LM Navigator workflows

Save Time

Reduce Context

Unify Your

INDIVIDUAL VALUE

27 minutes back, every morning

Conservative impact scenario — a 30% reduction against the survey median

90m → 63m

before with UNIFY

27 min per morning

2.25 hrs per week

108 hrs per year

The value goes beyond time

- ✓ A clear starting point instead of several disconnected inboxes
- ✓ A ranked list of what actually requires attention
- ✓ Less repeated reading and context switching
- ✓ Greater confidence that nothing important was missed
- ✓ More uninterrupted time for engineering, program & mission work

What our 140 respondents said would save them the most time

UNIFY was built directly around the top two: finding action items and a morning brief of changes.

Come back to a plan, not a pile of messages

Impact scenario — a 50% reduction in return-to-work catch-up time

3.5h → **1h45**
before with UNIFY

105 minutes recovered per return

- Faster identification of decisions made while away
- Less time reading outdated or low-priority threads
- Lower risk of missing requests, deadlines or commitments

A briefing organized by priority, not chronological order

- ✓ What changed
- ✓ Actions assigned to you
- ✓ Upcoming deadlines
- ✓ Decisions made
- ✓ People awaiting response
- ✓ Informational-only items

Every item links directly back to its original source.

Time spent in Teams, Outlook & Calendar catching up

Cumulative share of respondents at or under X hours (n=110, out 1+ week)

42% are back on track within 3 hours — the rest carry the delay much further

Minutes recovered scale into mission capacity

90 hrs
recovered per user, annually

ACTIVE USERS	HOURS / YEAR	CAPACITY VALUE*
1,000	90,000	\$9.0M
5,000	450,000	\$45M
10,000	900,000	\$90M

*Assumes \$100 fully loaded hourly labor cost.

RECOVERED / DAY

27 min

PER DAY

×

200

WORKING DAYS

=

90 hrs

PER YEAR

A focused deployment to **10,000 users** — roughly 8% of Lockheed Martin’s ~123,000 employees — could recover more than **900,000** productive hours annually.

Security built into the workflow, not bolted on

Stays In The Approved Environment

Self-hosted, open-weight gpt-oss-120b model

No content sent to public consumer AI services

Never used to train the model

Access limited to what the authenticated user can already view

Read-Only By Default

Summarizes and prioritizes — never sends or deletes

No autonomous emails or Teams messages

Users verify results via links to original sources

Any future write action requires explicit confirmation

Defense Against Prompt Injection

Teams messages, emails and webpages are treated as **data — not instructions**.

Separated system instructions from retrieved content

Source labeling & input sanitization

Structured output validation & restricted tool permissions

Human review before any consequential action

UNIFY brings AI to sensitive work context while preserving user permissions, source traceability, and human control.

From prototype to enterprise platform

A phased path from browser-extension proof of value to secure, governed enterprise deployment. Roadmap priorities were informed by recurring feedback from technical and non-technical users across business areas.

0–1 MONTH

Validate the Value

Purpose: Prove that UNIFY saves time without reducing trust or usefulness.

- Pilot with 10–20 employees across several job functions
- Measure time saved vs. normal workflow

Goal: Meaningful time saved without losing trust

1–3 MONTHS

Harden the Integration

Purpose: Move from prototype mechanics to a more reliable, scalable technical foundation.

- Replace scraping with Microsoft Graph integrations
- Standalone UNIFY interface on Genesis backend
- Add audit logging, traceability & admin controls

Goal: Reliable and ready for a broader pilot

3+ MONTHS

Scale Responsibly

Purpose: Expand only after value, security, and governance are validated.

- Expand to selected programs & business areas
- Add role-based configurations & Jira / Confluence sources
- Add governance, monitoring & recurring security testing

Goal: Scale only once value and security are proven

User Interview Themes That Shaped the Roadmap

Trust & Accuracy

Users want to trust that the brief captures what actually matters and does not miss critical context.

Source Traceability

Users want to trace outputs back to the original email, Teams thread, calendar item, or future system of record.

Role-Specific Workflows

Users across technical and non-technical functions want the brief to reflect their role, priorities, and working style.

Security & Governance

Users and stakeholders expect broader rollout to include approved integrations, admin controls, and auditable behavior.

These scalability considerations were informed by user interviews and feedback across technical and non-technical roles.

Early feedback validates the need

“

"UNIFY is a very useful AI tool that has potential for large cost & time savings. UNIFY enables me to spend less time scraping through large volumes of email & IM's by highlighting the important items. As a leader, it's helped me balance my workload by prioritizing which items require my immediate attention and decide which items can wait."

— Tanner Madsen, Software Engineering Manager, TB&S

108 of 143 respondents
said they would be willing to test UNIFY

The demand signal is clear: in our own 140-respondent survey, **62%** asked for help finding action items and **60%** asked for a morning brief — strong early signals for a tool built to cover far more of the workday than that.

UNIFY

Start ready. Return caught up.
